TRANSITION-01-11

Carbon4Minerals

Full Title: Transforming CO₂ into added-value construction products

Aim:

Carbon4Minerals develops innovative technologies for CO₂ capture and use in the production of carbon-negative minerals for high-value construction products, with the potential to reduce CO₂ emissions by 80% - 135% compared to cement-based reference materials. Thus Carbon4Minerals supports climate mitigation while safeguarding the competitiveness of European industry. The cement industry (responsible for 6-8% of global GHG emissions) is looking for alternative materials to replace Portland clinker, to reduce the enormous amounts of CO₂ emitted during the calcination of limestone. This need is particularly dire in view of the steel industry's transition to H₂-based DRI-EAF, thereby phasing out blast furnace slag as cement replacement.

Concept:

The core concept of Carbon4Minerals addresses the simultaneous use of CO₂ from industrial flue gases with current and future waste streams to unlock a vast stock of resources for innovative low carbon binders and construction materials (80-135% lower CO₂ emissions).

Start date:

01/01/2023

End date:

31/12/2026
